# Installing solar requires energy storage

Why do solar panels need battery storage?

Solar panels generate electricity only when the sun is shining, which means that without storage, excess energy generated during the day goes unused or is sent back to the grid. Solar battery storage systems allow users to retain this excess energy and utilize it when needed, improving overall energy efficiency and reliability.

Can a solar system support battery storage?

Most solar systems can support battery storage, but the method of installation depends on the existing inverter. In an AC-coupled retrofit, the current solar inverter remains in place, and a separate battery inverter is added. This setup is easier to install but less efficient due to the double energy conversion mentioned above.

Should you invest in a solar battery energy storage system?

Investing in a solar battery energy storage system offers numerous benefits, including: Energy Independence: Reduce reliance on the power grid and have access to energy anytime. Cost Savings: Lower electricity bills by using stored energy during peak hours when grid electricity is more expensive.

How do I Connect battery storage to a solar PV system?

There are two main ways to connect battery storage to a solar PV system: AC-coupled systems use the existing solar inverter along with a separate battery inverter. This setup is easier to retrofit since it does not require replacing the current inverter. However, it is slightly less efficient because the energy is converted twice.
