# Solar automatic heating system

What is a solar heating system?

The solar heating system is a thermal process that enables the conversion of solar irradiation into useful heat energy exploited for space heating and domestic hot water production. In this section, the various approaches, passive and active, adopted for space and water heating purposes are discussed.

What are solar-assisted heat pumps?

Solar-assisted heat pumps allow an enhancement of heating production when the exploitation of solar energy through a direct space heating system is not enough to meet the heating loads. However, the performance of the system can decline if the solar radiation is far below the required level.

What is a solar heating system (SHS)?

A solar heating system (SHS) is defined as a system that utilizes thermal technology to convert solar radiation into heat, which is then transferred to a medium like air or water for applications such as residential water heating or industrial processes.

What are active solar heating systems?

On the contrary, active solar heating systems rely on heat pumps that transfer the collected heat from the solar collectors to the building. In contrast to photovoltaic panels that generate electricity, thermal solar panels are used to capture energy from the sun and utilize it to provide the abovementioned commodities.

Active solar heating is a system that harnesses solar energy using technical devices, such as solar collectors, to convert it into usable heat in a building. Unlike passive ...
